### INTRODUCTION

Controllershship is not a new concept in modern business management. It is even less recent in the field of government. The office of Controller has been incorporated in the management structure of private business for many years, and it appears to be steadily increasing in numbers and in importance. The Federal government has also enjoyed the services of a controller in its administrative branches. The controllers themselves have followed the pattern of other professional groups and have organized the Controllers Institute of America to further promote and distinguish controllership as a profession. Universities have modified many of the scheduled courses in Business Administration to embrace the controllership aspects of business management, and in some instances, as at George Washington University, special courses are being conducted with particular emphasis on the various phases of controllership. The concept appears to be gaining favor in all quarters, even in Congress, as a necessary management tool. The present Administration's theme of "cost consciousness" has been conveniently associated with controllership as the remedy for a long illness.

It is not grossly irrational, therefore, to conclude that the concept of controllership in business and in government must offer a real contribution to management. If this is true, is it not also logical to ask: "What is this contribution? What does a controller do? What are the functions of the controller's office?" Unfortunately, the answers to these

# INTRODUCTION

Controlship is not a new thing in modern business management. It is in fact, one of the oldest and most important of the principles of management. The office of Controller has been established in the management of private business for many years, and it appears to be steadily increasing in importance. The Federal Government has also adopted the services of a Controller in its administrative branches. The Controller's duties have followed the pattern of other professional groups and have organized the Controller's Institute of America to further promote and distinguish Controllership as a profession. Universities have included many of the same related courses in business administration to recognize the Controllership as a part of business management, and in some instances, as an elective subject in the University, special courses are being conducted with business administration on the various phases of Controllership. The change appears to be gaining favor in all quarters, even in Germany, as a necessary management tool. The present Administration's Bureau of "Public Administration" has been recently reorganized and Controllership is the result of a long illness. It is not merely financial, statistical, or accounting, but the complete control of Controllership in business and in Government, with a well organized system of management. It is in fact, as it has been, and it is not only subject to the "what is this Controllership" and does a Controller not have the same kind of the Controller's office" and, naturally, the answer is given

questions are not only inconsistent and divergent in opinion, but downright confusing. In all quarters of business management and government administration there are many concepts of the functions of a controller, and they are quite often inconsistent with actual practices. The academic writings, although less divergent in opinion, have been conveniently directed toward control of the figure function in business management, and the student is understandably confused as to the real contribution of controllership.

There is probably some merit to each of the various concepts of controllership because each idea embraces certain functions which appear most important to individual situations and to certain professional groups. But there is evidence of abuse of the controllership concept in business, and it appears that a concerted effort is being made by the accounting profession to peg controllership to control of the figure function in business management. This is indeed an unfortunate movement and surely compromises the real need for controllership in the management structure. If allowed to continue, controllership is doomed to die a traitor's death and management will have failed to protect the interests of the stockholders; responsibility will be misdirected and the controller's office will bear the burden of guilt because management did not receive vital information.

This paper is an attempt to analyze the various controllership concepts and to point out wherein certain practices are not fulfilling the real need of management. If the controllership concept is a valid management tool, it must offer a real contribution. The role of controllership should lend itself to variation with respect to the scope and magnitude of individual situations, but not to the aim of making a real contribution to management. A concept of this management role of controllership will be presented

...is not only theoretical and divergent in opinion, but also  
...in all quarters of business management and government  
...administration. There are many examples of the confusion of  
...and they are quite inconsistent with actual practice. The  
...witness, although less divergent in opinion, was more conventional  
...referred to the control of the firm's function in business management, and  
...the evidence is overwhelmingly in favor of the real contribution of  
...control.

There is probably some merit to each of the various concepts of  
...control, but because each has different certain functions which appear  
...most important to individual visionaries and to certain professional groups.  
...But there is evidence of some of the control concepts in business,  
...and it appears that a somewhat effort is being made by the accounting pro-  
...fession to get control concepts in control of the firm's function in business  
...management. This is indeed an unfortunate situation and surely contributes  
...the real need for control in the management structure. It allows  
...to continue, control is indeed as the firm's death and resurre-  
...tion will have failed to protect the interests of the shareholders; respon-  
...sibility will be abdicated and the controller's office will bear the burden  
...of unit economic management and not receive that information.

This paper is an attempt to analyze the various control concepts and  
...to point out certain principles and not following the real  
...of management. If the control concepts are a real management  
...tool, as was after a real revolution. The role of control should  
...lead itself to various ways to the firm and contribute to indivi-  
...dual efficiency, but not to the firm's real contribution to manage-  
...ment. A concept of control management role of control should be presented

in the following paragraphs. It is not expected that every one will agree with the interpretation presented herein, although it is partly subscribed in many quarters. However, there can be little quarrel with the management needs that are presented, and the arguments discussed here merely nominate the controller to fulfill those needs and thereby make a real contribution to management.

IN THE MATTER OF THE ESTATE OF JAMES EARL RAY, JR., DECEASED.  
 THE COURT, upon reading the will of the deceased, and the petition of the executor, do hereby order that the said will be admitted to probate, and the said executor be and he is authorized to collect and receive the assets of the said estate, and to distribute the same to the persons entitled thereto, and to execute all other duties of an executor in and to the said estate.

## PART II

### EVOLUTION OF THE CONTROLLERSHIP FUNCTION IN AMERICAN BUSINESS

Early history.--The office of Controller is not a modern innovation in American business. Early history dates back to 1880, when The Atchison, Topeka & Santa Fe Railway System established the office of "Comptroller."<sup>1</sup> It appears that the railroads were the first of the American business corporations to recognize the need for a controller in the management organization. This was undoubtedly due to the rapid expansion of the railroad empires between 1860 and 1880. During this period the transportation system of the country was undergoing a major change. The railroads were expanding their networks; equipment was being radically improved with the invention and use of the Pullman car, the diner and the refrigerator car; the first steel rails were rolled in 1865 from Bessemer steel; and Federal, state and local governments were convinced of the growth potential and gave the railroads substantial land grants and other financial aid.<sup>2</sup> It is not surprising that it was during this period that the railroads first recognized the need for additional management control of financial activities. The Southern Pacific Company established the office of comptroller in 1885, the New York, New Haven & Hartford Railroad Company in 1887, the Illinois Central System

## RESEARCH IN THE UNIVERSITY OF CHICAGO IN ECONOMIC HISTORY

Early history.—The office of Controller is not a very important  
in American business. Early history dates back to 1790, when the  
Treasurer James M. Smith began his office as "Controller."  
It appears that the business was the first of the business con-  
troller to be established in the business office.  
The office was established in 1800 and was the first of the business  
office between 1800 and 1850. During this period the business office  
of the country was undergoing a rapid change. The business was expanding  
and the business office was being rapidly improved and the business  
and use of the business office, the business and the business office  
and the business office in 1850 was the business office and the business  
office business were established in the business office and the business  
office business in 1850 and the business office. It is not surprising  
that it was during this period that the business office was established  
for business business control of business business. The business  
office business established the office of business in 1850, the first  
business business business in 1850, the business business business

Part II. History and the business office.

The business office (Chicago, Illinois, 1900, p. 10.)  
1850, p. 10.

and the Lehigh Valley Railroad Company in 1890.<sup>3</sup> It is important to note that this initial recognition of the controllership function in American business was for the control of certain financial activities, rather than for the accounting function.<sup>4</sup>

The great rise of American industrial corporations followed in the wake of the transportation revolution. During the first ten years of the new century the value of manufactured goods doubled; the volume increased by two-thirds; and the number of manufacturing workers increased forty per cent.<sup>5</sup> This period of expansion was really launched in the latter quarter of the nineteenth century by the many new scientific discoveries and technological applications. Electricity for light and power, the telephone for voice communication, and numerous other important discoveries exploded in the lap of American industry. It is not surprising then that it was also during this period that industrial corporations recognized the need for additional control of certain management functions and established the office of controller. The earliest industrial controllership was established by the General Electric Company in 1892, and the Consolidated Edison Company of New York, Incorporated established a similar office in 1900.<sup>6</sup> Again, it is important to note that the early controller was not the chief accounting officer. His duties related largely to financial matters and policies.

Recent history.---Since the turn of the century nearly all areas of business activity have been embraced in a vigorous and continuous pattern of

(Continued on next page)

growth and expansion. However, a chart of the various industrial indices shows dramatically that the dynamic progress of American industry has not been without periods of hesitation, temporary reverses and forced mobilization of industrial capacity. It is not difficult to see that the various periods of recession, depression and war shook the American economy to its foundations. Although the acceptance of controllership by American industry was gradually increasing, it appears that these periods of stiffening competition and government regulation gave impetus to the recognition of the controllership function as a management tool. The world depression of the thirties separated the men from the boys, and top management has since been ever mindful of the lessons that were learned. Two world wars have also left their scars on the economy of the nation and the managers of American business have learned much during these periods. Competition is the key to American business activity, and management has learned that a rapidly expanding economy provides a dynamic environment for expansion of new industries which come to life and survive as lasting competitors.

During the past decade the controllership concept has gained considerable favor both in business and in government. This period especially has been one of full employment and expanding production, new discoveries and technological developments, particularly the revolution in electronics and aviation. The atomic bomb and its associated developments have caused much concern and forward thinking with regard to the pattern of future expansion. This rapidly expanding economic atmosphere, the increase in size and complexity of business activities, and the mounting government intervention and control of business and private affairs has greatly increased the scope and magnitude of management responsibilities. It is not unusual that management, beset with these expanding responsibilities,

[illegible]

should recognize the need for additional assistance for management planning and control. This recognition has resulted in the increasing acceptance of the controllership concept in American business.

Organization of controllers.--Evidence of the growing importance of the controllership movement was highlighted when the individual controllers expressed the need for a national organization through which experiences could be compared and procedures and standards established to assist them in meeting their responsibilities more effectively. Such an organization would also help considerably in distinguishing and promoting controllership as a profession and shorten the ladder to real management status. Thus, a national organization of controllers was established in December, 1931, with the impressive title of "The Controllers Institute of America."<sup>7</sup> The rapid exchange of information and preparation of papers on technical subjects led to the publication of a monthly magazine, "The Controller", which was undertaken in February, 1934.<sup>8</sup> Local organizations, called Controls, can now be found in nearly all major cities and other industrial communities.

<sup>8</sup> Ibid., p. 35

World Service has used for additional assistance the management planning and control. This organization has provided in our knowledge everything of the world service except in certain countries.

Organization of World Service.—The purpose of the growing importance of the world service movement and significant that the industrial countries appeared the need for a national organization through which they could be organized and coordinated and eventually related to other nations in meeting their responsibilities more effectively. Both an organization would also help considerably in establishing and promoting international relations and thereby the ladder to world peace and unity. Thus, a national organization of countries was established in December, 1918, with the objective of "the development of peace and unity." The world service of information and promotion of peace in national and international relations is a monthly journal, "The Quarterly," which was published in January, 1919. <sup>8</sup> World organizations, called quarterly, now are known to carry all other ideas and other national organizations.

### PART III

#### PRESENT CONTRIBUTION OF CONTROLLERSHIP TO BUSINESS MANAGEMENT

Trend toward accounting functions.--Since the controllership concept has been widely accepted as a management device, it should not be difficult to delineate the various functions that are the responsibility of a controller in business today. Unfortunately, this is not the case. There are many variations and opinions in regard to the functions of a controller. The Controllers Institute of America has attempted to clarify this problem by defining the profession's position in regard to the responsibilities of the controller's office, and by setting to print a list of specific duties and a form of by-law for a corporation to govern the controller's office.<sup>1</sup> This undoubtedly has offered some guidance to recent organizational changes. However, many corporations established the office of controller and assigned responsibilities in accordance with the problems that appeared significant at that time. Such organizational relationships are difficult to change, and although the controller may be a member of the professional Institute he must still conform to the dictates of his company.

This variance and confusion as to functions and responsibilities appear to have weakened the contribution of controllership to management. The accountants have taken advantage of this weakness to drive a wedge into the management structure, thereby obtaining promising opportunities for the

UNITED STATES OF AMERICA  
TO THE SECRETARY OF THE ARMY

General Board of Engineers, Army Corps of Engineers

There has been much discussion as to whether or not it is desirable to have a separate board of engineers for the Army. It is suggested that the various functions of the Army be divided into two main categories, namely, the engineering functions and the administrative functions. The engineering functions should be handled by a separate board of engineers, while the administrative functions should be handled by the War Department. This suggestion is based on the fact that the engineering functions are of a technical nature, while the administrative functions are of a general nature. It is suggested that the board of engineers should be composed of representatives of the various engineering branches of the Army, and that it should have the authority to make recommendations to the War Department regarding the engineering functions of the Army. It is suggested that the board of engineers should be organized on a permanent basis, and that it should have a fixed office in the War Department. It is suggested that the board of engineers should be organized on a permanent basis, and that it should have a fixed office in the War Department. It is suggested that the board of engineers should be organized on a permanent basis, and that it should have a fixed office in the War Department.

The Secretary, (General, 1917), p. 16.

accounting profession. This initial thrust can be likened to a military maneuver in that the accountants have gained a position of advantage and now appear to be on firm ground and gradually moving forward. A cursory examination of current writings on Controllershship and of the actual responsibilities of present controllers will confirm this fact. The accounting profession appears to have sold the managers of American business corporations that controllership is the control of the figure function in business management and that the head accountant is the most qualified man for that office. Since the accountants have cornered the controller market, it can be expected that the various technical papers and academic writings, along with the recommendations of the Controllers Institute, will be directed toward control of the figure function. In this manner the role of controllership in business is being skillfully steered down the path to the Chief Accountant's office. Note the direction of this guidance as being down rather than up, or in military parlance--a retreat rather than an advance. Further amplification of this point will be made in later paragraphs.

Current writing on controllership.--Since the controllership concept is enjoying a period of increasing popularity, quite naturally the academic writings are being pushed to keep pace with the movement. Many studies are being made, and it is not surprising that most of the technical articles and books are being authored by members of the accounting profession. It also is not surprising that the contents of these writings are generally in agreement with the recommendations of the Controllers Institute of America. In nearly all cases the controller's primary responsibility is defined as Chief Accountant. His management contribution is a secondary function. I will document this statement with specific examples. One of the most recent books on controllership, which is recommended by the profession as an excellent

[illegible][illegible]

treatment of the subject, sets forth this definition: "'Controller' is the title accepted in this book as signifying the position of the chief accounting and statistical officer."<sup>2</sup> The authors are both Certified Public Accountants--one a university professor and the other a controller in industry. Another popular book states that controllership, "in spite of its many ramifications, is basically the record-keeping and reporting function."<sup>3</sup> Again, the author is a Certified Public Accountant and a controller in industry. The Corporate Treasurer's and Controller's Handbook has this to say: "In the modern business corporation, the title is used ordinarily to designate the principle officer in charge of accounts."<sup>4</sup> A recent accounting text states that "in a typical case, the Controller will be designated as the chief accounting officer of the company, with powers..."<sup>5</sup> Compare these statements with the by-law for a corporation that the Controllers Institute recommends to define the duties of a controller:

The duties of the controller shall be to maintain adequate records of all assets, liabilities, and transactions of this corporation; to see that adequate audits thereof are currently and regularly made; and, in conjunction with other officers and department heads, to initiate and enforce measures and procedures whereby the business of this corporation shall be conducted with the maximum safety, efficiency, and economy. He shall attend all meetings....<sup>6</sup>

In view of these facts, there can be little argument with the charge that the accounting profession is guiding the movement of the controllership

concept in American business. The accountants can, therefore, be held accountable for the role of controllership and for its contribution to business management. Let us next take a look at the present status of controllership in business and at the functions it is performing, and then analyze these functions in terms of their real contribution to management.

Status of the Controller.--As mentioned previously, many companies have established the office of controller, but do not subscribe to all of the recommendations of the Controllers Institute in regard to the functions, responsibilities, and status of the office. In one company the controller may operate in a staff capacity only, while in others he may have line responsibility--or he may function in both capacities. In one company he may be the chief accountant--in others the auditor, treasurer, or administrative assistant. Many controllers enjoy management status by official title as vice president--others are pegged as assistants in the lower echelon of management. In many cases the position has been given official status by specific by-laws of the corporation, while in others the office is merely established by management. Again, the role of a controller in American business appears to depend upon the requirements of the individual business enterprises at the time the office is established.

A method of business administration--such as controllership--cannot grow and be widely accepted by American business without evidence of certain trends within its movement, especially under the guidance of large professional groups such as the Controllers Institute and other accounting organizations. For example, a 1947 survey of more than fifty companies, representative of a wide range of business from the standpoint of size, geographic location, and type of industry, indicated that certain trends were definitely in progress within the controllership movement. This study was conducted by

[illegible]

the Metropolitan Life Insurance Company in cooperation with the Controllers Institute of America. The following observations were indicative of the trend in regard to the status of the controller in 1947, and present practices appear to reaffirm this study:<sup>7</sup>

1. The controller's job is pretty generally established as an official one, with the title of Vice President.

2. The prescribing of the duties of the controller in the corporation by-laws is not as commonly followed as might be expected from the official status of the position. Usually the duties, as prescribed in the by-laws, are expressed in rather broad, general terms.

3. Typically, the controller is not a member of the board of directors.

4. Most commonly the controller is appointed or elected by the board of directors.

5. Since the controller ranks as a senior company executive, it is customary to find him reporting directly to the chief executive or top management of the company.

Unquestionably, the controller is not on the second team--he is a member of the management group, and it logically follows that his functions should relate to management problems. Interesting statistics are available in this regard.

Functions and responsibilities.---It would probably be difficult to find two controllers with identical functions and responsibilities. However, there are certain areas in which the controller normally operates, and variations in regard to specific duties are affected by the characteristics of each type of business. The survey conducted by the Metropolitan Life Insurance Company points out those areas in which the controller is normally interested. In order to get some measure of the extent to which specific duties were assigned to a controller and the variations in practice, a composite check list of activities was prepared and the companies participating in this study were asked to indicate those for which the

(k) Negotiation or assistance in negotiation of government contracts or plant extensions . . . . .	3	22

The above data clearly indicates that the contribution of the controller's office is primarily in the area of general accounting activities. Although this survey was conducted in 1947, there is little evidence to indicate any significant changes in current practices. This, of course, can be expected because of the large dependence of controllership on accounting data. Further analysis of these statistics, from the standpoint of predominant responsibilities, reveals a very interesting and significant situation with respect to the contribution of controllership to management. The following summary clearly points out the relative interest in the various areas of responsibility:

0. 1250/1000 and 1000/1250

of responsibility

Number of companies  
in which responsibility  
was assigned to the controller

1. Primary functions.

(a) Financial and statistical reports	46-51
(b) Auditing accounting activities	47-50
(c) Record-keeping	46-49
(d) Tax requirements	45-48
(e) Inventory control	43-44

2. Secondary functions.

(a) Budgetary control	33-36
(b) Government contracts and controls	25-31
(c) Office management	18-35
(d) Insurance	24
(e) Economic studies	23
(f) Credit and collections	16-23

3. Minor functions.

(a) Sales forecasts	20
(b) Financial activities	17-18
(c) Pricing	10
(d) Management engineering	8
(e) Purchasing	6

4. Obscure functions.

(a) Analysis and interpretation of operational data	0
(b) Management planning	0
(c) Coordination of business activities	0

These observations are rather alarming when considered from the standpoint of the contribution of controllership to management. The major effort appears to be in that area of business management which has long been controlled by the accountants--that of record-keeping and reporting. True, the accounting requirements have been vastly increased because of the expanding complexity of business, but record-keeping and reporting alone do not provide management with all the information necessary for effective and efficient

management. Controllershship must pay its way--it must make a contribution in addition to that of record-keeping and reporting. Failing in this, there can be little justification for calling the chief accountant a controller. Unfortunately, the increasing accounting requirements appear to have resulted in a compromise of the controller's responsibilities. There is evidence that many controllers are so concerned with the details of record-keeping that they are unable to devote adequate attention to other management functions. This fact is particularly highlighted in the above summary. It was also confirmed by a number of controllers who spoke to the Navy Graduate Comptroller-ship Class at George Washington University during the 1952-53 term. In nearly all instances, the controller's functions were almost entirely in the area of general accounting activities. Several were not even members of the budget committee, and others appeared to have no real management planning or administrative responsibilities.

It is heartening, at least, to see that approximately two-thirds of the companies did assign budget responsibilities to the controller. It is also encouraging to note that about half of the controllers were engaged in economic studies and forecasts. But throughout this entire survey and as evidenced in current practices, there seems to be a large void in the area of analysis, interpretation, planning, and coordination. It is charged, therefore, that the contribution of controllership has been considerably lessened by focusing interest on accounting details rather than on the broader aspects of obtaining the most useful control information available.

It is believed that management has contributed somewhat to this weakness by taking certain liberties with the office of controller. This is especially evident by the wide scope of responsibilities that have been assigned to the controllers.

[illegible][illegible]

It appears that in some instances management has found it convenient to promote the chief accountant, or some other employee, to the title of Controller. These advancements in status are suspect when increases in salaries are not commensurate with increased responsibilities, or, worse than that, when responsibilities are not increased at all. Further advancements may be effected by establishing the controller as an officer of the company. The practice of advancement in official status in lieu of financial gain is an old story in American business, and it can only lessen controllership's contribution to the management team.

in the case of the chief executive, or even other employees, in the case of  
Gentlemen. These arrangements in regard to the chief executive are  
entirely not commensurate with the responsibilities, or, more  
than that, with the responsibilities and the character of the  
office. It is not right to attribute the conduct of an officer of the  
office. The practice of advancement in official service is that of  
chief is in the office in service position, and is not only less than  
evolutionary's contribution to the management team.

## PART IV

### THE REAL ROLE OF CONTROLLERSHIP

#### Objectives

Contribution to management.---In order to clearly understand the objectives of controllership, it is necessary to review the facts with respect to why controllership has been accepted by American business. There are few who will disagree with the premise that controllership has been accepted because management found itself in need of assistance. This is the first significant fact; it was management who needed assistance--not the shareholder, not the board of directors, not the foremen or the supervisors. Is it not relevant, therefore, that the objectives of the controller should be aimed squarely toward making a contribution to management? More important, this contribution must be an addition to the management program--not an old office with a new name, but a new office with something to offer to pay its way.

Why did management need assistance? The answer to this question covers the broad gamut of nearly all business activities. It is tied directly to the social and economic evolutions that are a part of our way of life. More specifically, management needed assistance to keep pace with the changing environment of business that harbored progress and reverses, gains and losses, survival and chaos. A recent book on management planning and control aptly expresses this situation in the following manner:<sup>1</sup>

---

<sup>1</sup>B. E. Goetz, Management Planning and Control (New York: McGraw-Hill Book Company, Inc., 1949), p. 9.

Managerial problems are becoming more complex and more difficult. As a result, management needs more data, reported more promptly, more sharply oriented with respect to managerial problems and objectives, and more fully valid with respect to the changing environment of the enterprise. Major trends tending to increase management's need for data and for sharper focusing of data on problems are:

1. The growing scale and complexity of industry
2. The increasing use and importance of fixed capital
3. The increasing range and tempo of change
4. The increasing social control of business

The assistance that management needs and the reason why this need exists can now be seen quite clearly. The controller is ideally suited to advance in stature and provide this assistance to management. For this reason it was not difficult for American business to accept controllership in this expanded capacity. The objectives of the controller are, therefore, morally bound to the needs of management, and these objectives can be defined in the following manner:

1. To provide management with vital information with respect to all phases of the company's activities.
2. To provide current information that can be utilized effectively for planning and control--not historical data that is sterile for management purposes.
3. To provide information that will distinguish managerial problems and evaluate the objectives of management.
4. To provide analysis and interpretation of information to show management: (a) where it has been; (b) where it is now; (c) where it is going; and (d) what the danger signals are enroute.

Functions.--These objectives can be restated in terms of the specific areas of management in which the controller should make a significant contribution. These areas may be classified under four major headings:

As a result, management needs must be identified and defined in terms of the organization's mission and vision. The organization's mission and vision are the primary factors in determining the organization's needs. The organization's mission and vision are the primary factors in determining the organization's needs. The organization's mission and vision are the primary factors in determining the organization's needs.

1. The primary needs and objectives of the organization
2. The secondary needs and objectives of the organization
3. The tertiary needs and objectives of the organization
4. The quaternary needs and objectives of the organization

The relationship between management needs and the organization's mission and vision is a complex one. The organization's mission and vision are the primary factors in determining the organization's needs. The organization's mission and vision are the primary factors in determining the organization's needs. The organization's mission and vision are the primary factors in determining the organization's needs.

1. To provide information on the organization's mission and vision
2. To provide information on the organization's needs and objectives
3. To provide information on the organization's resources
4. To provide information on the organization's performance
5. To provide information on the organization's future
6. To provide information on the organization's current state
7. To provide information on the organization's past performance
8. To provide information on the organization's future prospects
9. To provide information on the organization's current state
10. To provide information on the organization's past performance
11. To provide information on the organization's future prospects
12. To provide information on the organization's current state
13. To provide information on the organization's past performance
14. To provide information on the organization's future prospects
15. To provide information on the organization's current state

17. To provide information on the organization's future prospects
18. To provide information on the organization's current state
19. To provide information on the organization's past performance
20. To provide information on the organization's future prospects

- (1) Accounting
- (2) Management audit and investigation
- (3) Management analysis and interpretation
- (4) Management planning and control

This is not necessarily the order of importance of the controller's functions, but rather the continuity of responsibility. Let us now examine in more detail the scope of each of these areas and the specific functions that should be the primary responsibility of a controller.

#### The Accounting Function

Staff versus line.---The accounting function of controllership is generally considered to be primarily record-keeping and reporting of accounting information. In this capacity the controller is usually the chief accountant, and is charged with the responsibility of devising, installing, and maintaining all general financial and cost accounting operations. In addition to this, he is normally charged with the auditing and tax responsibilities. This delegation of responsibility is the normal outgrowth from the acceptance of the accountant as the most qualified person in the business organization to direct the functions of the controller. It is true that most of the information utilized for management purposes is obtained by the accounting department, but management has enjoyed capable and efficient accounting services for many years and the accounting profession has been very progressive in its practices. The controller, however, must make an additional contribution to management. As a member of the management team, the details of supervising the accounting department and maintaining record-keeping operations become less important and the overall problems of methods, systems, and procedures become more significant. Critical analysis of checks and controls replaces the precise recording of accounting operations. The

controller's primary interest must be in the area of management and not as the head of an operating department. The controller must analyze all phases of the company's activities and advise and recommend with respect to managerial problems. He should, therefore, function primarily in a staff capacity. This is not a new concept of the controller's accounting function. One of the fundamental principles of internal control is that the record-keeping functions should be segregated and checked by some other employee. Victor H. Stempf advocated the segregation of the record-keeping function and the controller and had this to say on the subject:

I believe that the controller should design and formulate the methods of accounting to be pursued by the company, but I don't believe that he should be directly responsible for the internal recording of transactions. I think that is an operating function. The ideal setup in a large organization is to have a chief accountant, who reports directly to the general manager and is independent of the controller, and whom the controller checks.<sup>2</sup>

A recent technical publication on controllership also indicates that the real function of the controller is in a staff capacity, rather than as a department head. The author expressed his views on the subject in this manner:

If this expanding relationship of the controller to all management is truly indicative of a long-term trend, it raises the possibility that, as controllership acquires a broader or company-wide status, it will emerge on a plateau above the departmental level....Eventually, and particularly when top management does not itself possess controller experience, it seems possible that the function of controllership is likely to become more distinctly separated from accounting (and more distinctly dissociated from record-keeping). As a result, the weight of emphasis would undoubtedly tend to move further away from fact-finding, record preparation, and employee supervision toward fuller analysis and expanded interpretation as an aid to better management.<sup>3</sup>

I believe that the Communist Party should be the only party of workingmen in the United States, and I believe that it should be the only party of workingmen in the United States.

1. The first section of the report is devoted to a general description of the project and its objectives. It also includes a brief history of the project and a list of the personnel involved.

[illegible]

Colony River & Lake, Inc., 1960-61

This concept of segregating the controller from the record-keeping function is not merely a proposal or a whim of certain individuals. There is much evidence that business has already recognized the desirability of this arrangement. The survey conducted by the Metropolitan Life Insurance Company made particular note of this fact and reported as follows:

...there has been a definite change in the basic concept of the controller's position from that of a minor administrative function, concerned largely with accounting details and record-keeping, to that of a major factor in the control and profitable operation of the business as a whole. More emphasis is being placed on the controller as a staff executive serving in an advisory capacity to other departments and executives.<sup>4</sup>

From a practical standpoint, the size of the company would undoubtedly dictate whether the controller is charged with the record-keeping function of accounting. In a small business, it would probably not be advisable to segregate this function--primarily from a cost standpoint. The important thing is that the controller has sufficient time to effectively direct the more important management functions.

Systems, policies, and procedures.--The contribution of the controller in the area of accounting should, therefore, be concerned primarily with the determination of requirements for an effective financial and managerial accounting system. The major function of accounting is to serve managerial needs and to facilitate the attainment of managerial objectives. The determination of accounting requirements should, therefore, be made by management--not by an operating department. The implementation of these requirements can then be delegated by management to the chief accountant. This concept of the controller's responsibility for accounting embraces design and installation of corporate, financial, managerial, and cost-accounting requirements, together

---

<sup>4</sup>Functions of the Controller (New York: Metropolitan Life Insurance Company, 1947), p. 9.

Company was petitioned by this case and reported as follows:

This company is engaged in the business of manufacturing and distributing various types of machinery and equipment. It is a well established and financially sound company. It is a well established and financially sound company. It is a well established and financially sound company.

...there has been a definite change in the field concept of the  
controlling authority from that of a mere administrative function  
exercising control over the operating facilities and equipment, to the  
of a better understanding of the control and maintenance operation in the field  
and as a result, more emphasis is being placed on the maintenance of  
a well maintained facility in an industry agency in other organizations  
and individuals.

There is a general feeling that the time is ripe for a new kind of literature, one that is more concerned with the human condition than with the technical details of the scientific method. This feeling is based on the fact that the scientific method has been used to solve many of the world's problems, but it has also been used to create many of the world's problems. The scientific method is a powerful tool, but it is not a magic wand. It can only be used to solve problems that are well-defined and measurable. The human condition is a much more complex and elusive thing. It is not something that can be measured or quantified. It is something that can only be understood through the power of the imagination. The new literature that is being written is a literature of the imagination. It is a literature that is concerned with the human condition, with the struggles of the individual, with the hopes and dreams of the future. It is a literature that is written for the human mind, and it is a literature that is written for the human heart.

1. The first of these is the fact that the

with the methods, systems, internal controls, and policies that will enable coordinated accounting operations. This responsibility can be met in part by the preparation of an accounting manual covering all phases of company operations. The controller's responsibility is continuous and professional skill is required to keep abreast of the changing environment of the business world. A system of internal analysis and investigation must be constantly employed to assure accurate reporting of necessary information. Effective internal audit procedures, under the cognizance of the controller, will provide this assurance.

#### Management Audit and Investigation

The auditing function.---In order to attain the objectives outlined previously, management must be provided with information that can be utilized effectively for planning and control. It is important, therefore, that the implementation of company policies and procedures is continuously evaluated, and that an adequate system of checks and controls is established and constantly reviewed. Management must also be evaluated with particular regard to matters of organization, staffing, administrative procedures, and the utilization of personnel, materials, and facilities. This is the controller's responsibility. His tools for the job are (1) internal auditing, (2) internal checks and controls, and (3) management engineering.

Internal auditing.---Since the controller prescribes the accounting procedures, he should also be charged with making the work of the accounting department more efficient. This is the task of the internal auditors. The objectives of this function are not only to prevent weakness from developing in the accounting operation because of failure to follow prescribed procedures, but also to make constructive appraisals of existing procedures with an aim toward making improvements. Internal auditing is concerned with

with the methods, systems, devices, and policies that will ensure  
continued successful operation. This responsibility can be met in part  
by the provision of an accounting system covering all phases of company  
operation. The controller's responsibility is to maintain and protect  
this system on a day-to-day basis of the changing conditions of the business  
world. A system of internal controls and investigation must be constantly  
applied to secure accurate reporting of financial information. Effective  
internal audit procedures, under the direction of the controller, will give  
this this position.

#### Management Audit and Investigation

The auditing function.—In order to obtain the objectives outlined  
previously, management must be provided with information that can be relied  
upon for planning and control. It is important, therefore, that the  
implementation of company policies and procedures is continuously monitored,  
and that an adequate system of control and audit is established and con-  
stantly reviewed. Management must also be provided with periodic reports  
on matters of organizational, financial, administrative, personnel, and the  
utilization of personnel, materials, and facilities. This is the controller's  
primary responsibility. His duties for the (1) internal auditing (2)  
external checks and controls, and (3) management reporting.

Internal auditing.—Since the controller's position is responsible  
for the internal audit, he should also be charged with making the audit of the company's  
internal department more efficient. This is the task of the internal auditor.  
The objectives of this position are not only to provide business from de-  
veloping in the accounting operation because of failure to follow prescribed  
procedures, but also to give constructive assistance in making procedures  
and in the future better improvements. Internal auditing is concerned with

a wide range of management activities and its overall objectives may be defined as follows:

1. The ascertainment of compliance with the organization's rules, procedures, and policies of an accounting and financial nature and their related aspects.
2. The conservation of the organization's resources and general protection of its interests with respect to assets, liabilities, revenues, and expenditures, and their related implications.
3. The verification of accounting and financial data in a broad sense, together with effective analysis of them.
4. The appraisal of existing rules, procedures, and policies relating to accounting and financial and associated activities, together with constructive recommendations which are directed toward the improvement of general company welfare.
5. The training and encouragement of personnel, together with the provision of such circumstances and conditions as are most conducive to their welfare.
6. Other services to management of a direct nature in the way of providing an effective means of contact with field operations and an impartial reporting agency; the provision of personnel for executive positions; and the furthering of the efficiency and economy of the outside audit.<sup>5</sup>

Internal auditing makes a separate contribution to management. It supplements the accounting department, and by its analysis and interpretation lends greater validity to the accounting data and provides management with a sounder basis for direction and control.

Internal checks and controls.--It is difficult to separate the function of internal control from that of internal auditing. In fact, it is a part of internal auditing. However, because of the specific responsibility of management to safeguard the assets of the company, it is listed as a separate responsibility. Internal control embraces the analysis of accounting methods and practices and the establishment of a system of internal checks whereby the accounting forms and records are all coordinated and operated in such a manner that maximum protection is provided against irregularities. This is an important function from which management derives the

---

<sup>5</sup>V. Z. Brink, Internal Auditing (New York: The Ronald Press Company, 1941), p. 38.

1. The establishment of a relationship with the organization's policy, procedures, and policies of an accounting and financial nature and their related aspects.
2. The coordination of the organization's resources and control procedures of the business with respect to financial, managerial, operational, and other related policies.
3. The verification of accounting and financial data in a broad manner together with effective analysis of them.
4. The approval of accounting, procedures, and policies relating to accounting and financial and associated activities, together with non-financial recommendations which are discussed between the management of general company affairs.
5. The creation and maintenance of personnel, together with the provision of such information and consultation as is most necessary to their welfare.
6. Other services to management of a direct nature in the way of providing an effective means of control and their operations and an internal reporting agency; the provision of personnel for accounting positions and the functioning of the accounting and financial departments within the audit.

Internal auditing makes a separate contribution to management. It supplements the accounting department, and by its analysis and interpretation gives greater validity to the accounting data and provides management with a sounder basis for decision and control.

Internal control and auditing—It is difficult to separate the function of internal control from that of internal auditing. In fact, it is a part of internal auditing. However, because of the relative responsibility of management to safeguard the assets of the company, it is placed as a separate responsibility. Internal control embraces the analysis of accounting methods and procedures and the establishment of a system of internal checks whereby the accounting books and records are all controlled and operated in such a manner that serious frauds are prevented against their detection. This is an important function from which management derives the

maximum utility from the accounting records with respect to information, protection, and control.

Management engineering.--There are many differences of opinion in regard to the status of the management engineer. But, regardless of professional interests, the work of the management engineer and the internal auditor is essentially the same in certain areas of evaluation. Therefore, since the controller is charged with complete management audit, there can be little argument for excluding the management engineer from the controller's organization. In fact, it lends continuity and coordination of effort to the evaluation of the entire business organization.

#### Management Analysis and Interpretation

Financial and operating reports.--The analysis and interpretive function is one of the most important contributions that controllership can make to management. It should be the controller's responsibility to assemble the necessary financial and operating data, to conduct thorough analyses and interpretations, and to report to management in a manner that will enable effective utilization of these data for administrative planning and control. Financial and operating reports are management's only means of measuring the operations of the company, and they are, therefore, the basic foundation for nearly all decisions with respect to company policy and planning. In addition, there are certain legal requirements for company reports which the controller should prepare because of the liability accruing to the company. The increasing social control of business is making this function more important every day.

The controller who functions in a staff capacity, rather than as the head of an operating department, is in an advantageous position to conduct critical and constructive analysis, and to interpret the facts and figures

moderate utility from the accounting records in the operation.

[illegible]

financial and operating reports--The financial and operating reports  
 are one of the most important documents in the financial and operating  
 management. It should be the responsibility of the financial and  
 operating management to prepare and present these reports in a clear and  
 concise manner. The financial and operating reports should be prepared  
 and presented in a manner that is consistent with the financial and  
 operating management's policies and procedures. The financial and operating  
 reports should be prepared and presented in a manner that is consistent  
 with the financial and operating management's policies and procedures.

The Committee has therefore in a well equipped, varied team of  
doctors and nurses, who are all of the highest quality, and to be  
able to deal with any emergency, and to be able to deal with any  
emergency, and to be able to deal with any emergency.

to assist management in the measurement of results and in the formulation of plans and policies. The presentation of essential facts in such a manner that they can be readily understood is the real climax to the controller's contribution to management. However, presentation alone may not be sufficient. The controller must successfully communicate these facts to management. He must understand the attitudes, viewpoints, and problems of management, and make sure that the real meaning of the reports he submits is clearly understood. This is a problem that requires continuous effort and the controller should be free to devote adequate attention to this end. Fruition of the controller's efforts can be enjoyed only by successful communication of the essential facts.

Economic studies.--The reporting of external information on markets and competitive activities and on general economic activities is not usually considered a controllership responsibility; yet a cursory examination of the facts clearly indicates that these activities must be considered in the analysis and interpretation of financial and operating data. If financial and operating reports are to be useful for management planning, they must be collated with the various economic influences. The controller should, therefore, be responsible for assembling this information and for evaluation with respect to the effect on operations of the company. Economic trends are vital to management planning. A knowledge of past movements is as necessary as a record of the tides is to a ship's captain. Nearly all plans are based on forecasts and expectations. Therefore, research and study of economic and market movements are essential for complete analysis and interpretation of operating data. The stock market is a useful barometer for financial planning. There are numerous areas for continuous observation, such as interest rates, credit levels, inventory levels, trade practices, price controls,

of the committee's efforts was to support only by successful communication  
which should be free to have complete freedom to take any position  
advisable. This is a problem that requires serious study and the com-  
mittee has been very busy in the last few days in order to make it clear  
that it has no intention of withdrawing, changing, and perhaps of making  
itself. The committee will continue to work hard to bring  
to the attention of management, Congress, Government and the public  
that they are really interested in the fact that in the committee's  
view and policies. The committee is essential to have a money  
to make money in the business of twelve men in the organization of

[illegible]

labor movements, industrial indices, etc. To deny controllership the study of these influences can only diminish the value of the financial and operating reports.

### Management Planning and Control

Budgetary planning and control.---"The controller's responsibility begins with the reporting of facts about actual operations and extends naturally to the assembling, summarizing, and reporting of operating plans in the form of the budget and to comparisons with the reported results of other companies and of industry in general."<sup>6</sup> This statement clearly suggests that the budget is a tool for management planning and control, and that the controller should be responsible for this contribution. This is a real management function that can be accomplished best by a staff group--not by an operating department. Budgetary planning and control is a way of managing a business and it provides top management with the information it needs to effectively direct the operations of the company. The budget is the one tool that satisfies all of the objectives of management planning and control. These objectives, as stated in a recent article by a prominent consultant on management problems, are:<sup>7</sup>

1. Setting a profit goal.
2. Setting departmental goals which taken together will achieve the profit goal.
3. Measuring progress against those standards.
4. Making continuous adjustments to keep the whole organization moving in balance toward the goal.

It is not difficult to see that these objectives are completely embraced by effective budgetary procedures. This is an area of management that will make controllership pay its way in the management structure of

---

<sup>6</sup>Bradshaw and Hull, op. cit., p. 51.

<sup>7</sup>T. F. Bradshaw, "The Place of the Controller in Management Planning and Control," The Controller, (October, 1952), pp . 472-500.

These measures, however, would be very controlling in that  
of these measures can only bring the best of the financial and general  
the reports.

#### Management Planning and Control

##### Management Planning and Control—The controller's responsibility

begin with the planning of these short and long term  
units to the planning, controlling, and reporting of planning plans to  
the form of the budget and the comparison with the financial results of these  
operations and of industry in general.<sup>6</sup> These measures, which include

that the budget is a tool for management planning and control, and that the  
controller should be responsible for this construction. This is a tool for  
planning and control can be recognized first by a well known fact by an  
operating department. Management planning and control is a way of working  
a business and it provides the management with the information it needs to  
effectively direct the operations of the company. The budget is the key

fact that enables all of the objectives of management planning and control  
These objectives are listed in a recent article for a business controller as  
management planning, etc.<sup>7</sup>

1. Setting a profit goal.
2. Setting financial goals which when taken together will achieve the  
profit goal.
3. Establishing policies and procedures.
4. Setting standards of performance in line with the organization's mission  
in relation to the goal.

It is not difficult to see how these objectives are achieved by

planning of effective management procedures. This is the aim of management  
and all these objectives are met in the management process of

<sup>6</sup> Graham and Ball, op. cit., p. 41.

<sup>7</sup> L. F. Graham, "The Role of the Controller in Management Planning  
and Control," The Controller, (October, 1951), pp. 471-472.

American business. The only controlling factor is that management must recognize the need for budgetary planning and control. Budgeted businesses today are still in the minority, but it is a fact that the general trend is toward more budgetary control in industry. "It is an even more significant fact that, to the best knowledge of the authors, there is no case of any business having given up its budgetary control once it had been adopted by the organization."<sup>8</sup> This is, indeed, a remarkable observation, and it clearly indicates that one of the most promising contributions that the controller can offer management is in the area of budgetary control. Here is a real future for controllership. The authors of the above statement are even more enthusiastic about the role of budgeting in management and state that "budgetary control, when properly practiced, is probably the last word in the technique of scientific management and also the best method yet devised for developing the team spirit in any given organization."<sup>9</sup>

The survey conducted by the Metropolitan Life Insurance Company--which was discussed in Part III of this paper--showed that in actual practice budgeting was a secondary function of controllers in business. If the real objectives of management planning and control are as stated in the previous paragraphs, this practice in industry is not compatible with the objectives of management. It is probably safe to say that these objectives will not change--in fact, they are becoming more significant every day. Management must, therefore, recognize the need for budgetary control and charge the controller with this responsibility. It is only in this manner that the tools for efficient management can be used effectively, and controllership will in

---

<sup>8</sup>W. Rautenstrauch and R. Villers, Budgetary Control (New York: Funk & Wagnalls Company in association with Modern Industry Magazine, 1950), p. 263.

<sup>9</sup>Ibid., p. 264.

American business. The only intelligible theory is that management must be  
 unified and that the management planning and control, budgeting, forecasting, etc.  
 they are still in the infancy, but it is a fact that the present state is a  
 word with budgetary control as a basis. The fact is that budgeting  
 has been at the first stage of its evolution, there is no doubt of that.  
 business planning that up the budgetary control must be not only advised by  
 the organization.<sup>1</sup> But it is indeed a somewhat abstract and not a  
 individual that one of the most practical suggestions that the budgeting  
 other management is in the state of budgetary control. There is a real danger  
 for centralization. The essence of the early development of budgeting was  
 basis about the role of budgeting in management and what was "budgetary"  
 control, even though, however, as possibly, the fact that in the budgeting  
 of scientific management and also the fact that the budgeting is  
 the same as it is in the budgeting.<sup>2</sup>

The survey conducted by the International Labor Movement Committee  
 which was discussed in 1925 in the report—*Budgeting in the World*—which  
 budgeting was a necessary function of centralization in business. In the past  
 objectives of management planning and control are as stated in the previous  
 paragraph, this problem in industry is not comparable with the objectives  
 of management. It is probable that in the future objectives will be  
 changed—in fact, they are becoming more significant every day. Management  
 must, therefore, recognize the need for budgetary control and change the way  
 budgeting with this organization. It is only in this sense that the budget  
 for efficient management can be that effectively, and centralization will be

turn increase in stature and make a real contribution to management.

Government controls.--The increasing social control of American business has naturally distended the reporting requirements of business and also the internal control required to assure compliance with the numerous regulations, legislation, and social agreements. This is a relatively new area in management and one in which controllership can make a real contribution. Management needs capable assistance for the analysis and interpretation of these controls and for the development of decisions and policies in regard to the effect of these controls on the operations of the company. This is not only a large task, but also a very important one. Additional accounting procedures may be required for generating necessary information, and additional internal controls may be necessary to insure compliance with all regulations. The task will normally embrace legal analysis and arbitration of company problems, and the inauguration of programs that will commit the company to substantial financial responsibilities. This is a management function that should be assigned to the controller. It is a staff function that management needs in order to fulfill its responsibility to its shareholders.

...the Government is not responsible for the actions of the Government.

## PART V

### SUMMARY

The real role of controllership is a management function--not one of figure collecting, record-keeping, and reporting of accounting information. These functions do not provide management with the information it needs for effective planning and control of financial and operating activities of the company. These functions can be performed by any accounting department. Controllership must make an additional contribution to management. It must bring the facts and figures to "bear where and when they will do the most good--within the management process and before the decision is made. This combination of facts, figures, and the management viewpoint provides management with objective goals, objective appraisals of performance, and a balancing of the factors and opinions that result in management decisions."<sup>1</sup>

Controllership must analyze, interpret, and evaluate facts and figures that are generated within the company and within the business environment; it must collate this information with respect to the management viewpoint; and it must communicate this information to management in such a manner that it will be understood. In addition, controllership must provide management with effective business systems, procedures, and controls that will not only generate planning and control information, but will also protect the interests of the shareholders. These systems must embrace prudent business policies that will

The test of objectivity is a management decision—can it  
figure collecting, recording, and reporting of accounting information.  
There is no doubt as to the objectivity of the information it furnishes for  
all those planning and working in financial and operating activities in the  
company. These decisions are as free of any accounting department—can  
it really make any additional contribution to management. It must be  
the fact and figure in "best case and worst case" to the best good—  
also the management process and before the decision is made. This process  
is of fact, figure, and the management process provides management with  
objective facts, objective appraisals of performance, and a balance of the  
facts and figures that result in management decisions.<sup>1</sup>

Objectivity does not mean, however, and should not be taken  
that the process which the company and within the business environment; it  
must relate the information and report to the management process; and it  
must communicate this information to management in such a manner that it will  
be understood. In addition, management must provide management with all  
the financial means, processes, and controls that will not only provide  
planning and control information, but will also provide the increase of the  
company's. These systems must reflect present business policies that will

protect the assets of the company at all times. This is a management function that can be performed best in a staff capacity--not by an operating department.

Controllershship can achieve management status only by recognizing the needs of management--not by compromising the position to further the goals of the accounting profession. Management, in return, must recognize the need for this real role of controllershship. Failing in this, it will be difficult for management to protect the interests of the shareholders in the rapidly changing business environment that exists today.
